

Whether you deal with simple weighing or sophisticated weighing applications, the data printer YDP03-0CE quickly generates clear and traceable hard copies of the results of your work.

Using a BASIC program that is installed on any PC, you can customize the two headers of your printout, for instance, by entering your company logo and user name.

The YDP03-0CE has a built-in statistics program. By having the standard deviation, the mean value and the variation coefficient printed, you can add objective information to support your results.

The printer's high-contrast LCD shows you the date and time, informs you about the actual status of a measurement series, and helps you select just the function you need.

One satisfies all.

No matter which Sartorius weighing instrument you use, whether it's a high-resolution MC5 microbalance or a high-capacity Basic™, you'll always obtain a printout that perfectly meets all GLP, GMP and ISO EN quality standards in terms of presentation and content. This applies particularly to calibration and adjustment performed as part of monitoring and control of measuring instruments

These features of the Sartorius Data Printer will make your work much more convenient: clearly arranged, covered keypad, which is impervious to dirt, built-in real-time clock, and a large paper compartment to accommodate a roll of 50-m length paper. A symbol on the display shows you the battery level so that you'll know when to recharge the batteries installed in the printer if you operate the connected balance on battery power.
